PROJECT NAME	Calculating Family Expense using Service now

Date Flow Diagram:

Calculating family expenses within ServiceNow presents unique challenges due to its focus on enterprise IT and project management. While ServiceNow is powerful for managing large-scale financial data, adapting it for individual or family budgeting requires customization and may not be the most intuitive solution. Some key challenges include the lack of pre-built family budgeting modules, potential complexity in data input and reporting, and the need for significant configuration to align with personal financial needs.

Uses:

• ServiceNow allows you to create budget plans, which can be adapted for different spending categories like housing, food, transportation, etc.

• You can set specific monetary targets for each category, allowing you to track your spending against your goals.
